Ex.No:1	HADOOP INSTALLATION
Date:	

#### AIM

To Download and install Hadoop and Understanding different Hadoop modes, Startup scripts, Configuration files.

#### **PROCEDURE:**

**Step by step Hadoop 2.8.0 installation on Windows 10 Prepare:** 

These software's should be prepared to install Hadoop 2.8.0 on window 10 64 bits.

1) Download Hadoop 2.8.0

(Link: http://wwweu.apache.org/dist/hadoop/common/hadoop-

2.8.0/hadoop-2.8.0.tar.gz OR

http://archive.apache.org/dist/hadoop/core//hadoop-2.8.0/hadoop-

2.8.0.tar.gz)

2) Java JDK 1.8.0.zip

(Link: http://www.oracle.com/technetwork/java/javase/downloads/jdk8-downloads-2133151.html)

#### Set up:

- 1) Check either Java 1.8.0 is already installed on your system or not, use "Javac -version" to check Java version
- 2) If Java is not installed on your system then first install java under "C:\JAVA" Javasetup
- 3) Extract files Hadoop 2.8.0.tar.gz or Hadoop-2.8.0.zip and place under "C:\Hadoop-2.8.0" hadoop
- 4) Set the path HADOOP\_HOME Environment variable on windows 10(see Step 1,2, 3 and 4 below) hadoop
- 5) Set the path JAVA\_HOME Environment variable on windows 10(see Step 1, 2,3 and 4 below) java
- 6) Next we set the Hadoop bin directory path and JAVA bin directory path

## Configuration

a) File C:/Hadoop-2.8.0/etc/hadoop/core-site.xml, paste below xml paragraph andsave this file.

b) Rename "mapred-site.xml.template" to "mapred-site.xml" and edit this file C:/Hadoop-2.8.0/etc/hadoop/mapred-site.xml, paste below xml paragraph and savethis file.

- c) Create folder "data" under "C:\Hadoop-2.8.0"
  - 1) Create folder "datanode" under "C:\Hadoop-2.8.0\data"
  - 2) Create folder "namenode" under "C:\Hadoop-2.8.0\data" data
- d) Edit file C:\Hadoop-2.8.0/etc/hadoop/hdfs-site.xml, paste below xml paragraphand save this file.

```
<name>dfs.namenode.name.dir</name>
    <value>C:\hadoop-2.8.0\data\namenode
  cproperty>
    <name>dfs.datanode.data.dir</name>
    <value>C:\hadoop-2.8.0\data\datanode
  </configuration>
e) Edit file C:/Hadoop-2.8.0/etc/hadoop/yarn-site.xml, paste below xml paragraphand save
this file.
<configuration>
  cproperty>
      <name>yarn.nodemanager.aux-services</name>
      <value>mapreduce_shuffle</value>
  </property>
  cproperty>
      <name>yarn.nodemanager.auxservices.mapreduce.shuffle.class</name>
      <value>org.apache.hadoop.mapred.ShuffleHandler</value>
  </configuration>
```

f) Edit file C:/Hadoop-2.8.0/etc/hadoop/hadoop-env.cmd by closing the command line "JAVA\_HOME=%JAVA\_HOME%" instead of set "JAVA\_HOME=C:\Java" (On C:\java this is path to file jdk.18.0)

# **Hadoop Configuration**

- 7) Download file Hadoop Configuration.zip (Link:https://github.com/MuhammadBilalYar/HADOOP-INSTALLATION-ON-WINDOW-10/blob/master/Hadoop%20Configuration.zip)
- 8) Delete file bin on C:\Hadoop-2.8.0\bin, replaced by file bin on file just download(from Hadoop Configuration.zip).

9) Open cmd and typing command "hdfs namenode –format" .You will see hdfs namenode –format

# **Testing**

- 10) Open cmd and change directory to "C:\Hadoop-2.8.0\sbin" and type "start-all.cmd" to start apache.
- 11) Make sure these apps are running.
- a) Name node
- b) Hadoop data node
- c) YARN Resource Manager
- d) YARN Node Manager hadoop nodes
- 12) Open: http://localhost:8088
- 13) Open: http://localhost:50070

Ex.No:2	HADOOP IMPLEMENTATION OF FILE MANAGEMENT TASKS
Date:	

#### AIM:

To write a program to implement Hadoop Implementation of file management tasks

#### **PROGRAM:**

Implement the following file management tasks in Hadoop:

- i. Adding files and directories
- ii. Retrieving files
- iii. Deleting files

### **Adding Files and Directories to HDFS**

Before you can run Hadoop programs on data stored in HDFS, you,,ll need to put the data into HDFS first. Let,,s create a directory and put a file in it. HDFS has a default working directory of /user/\$USER, where \$USER is your login user name. This directory isn,,t automatically created for you, though, so let,,s create it with the mkdir command. For the purpose of illustration, we use chuck.

You should substitute your user name in the example commands.

hadoop fs -mkdir /user/chuck

hadoop fs -put example.txt /user/chuck

### **Retrieving Files from HDFS**

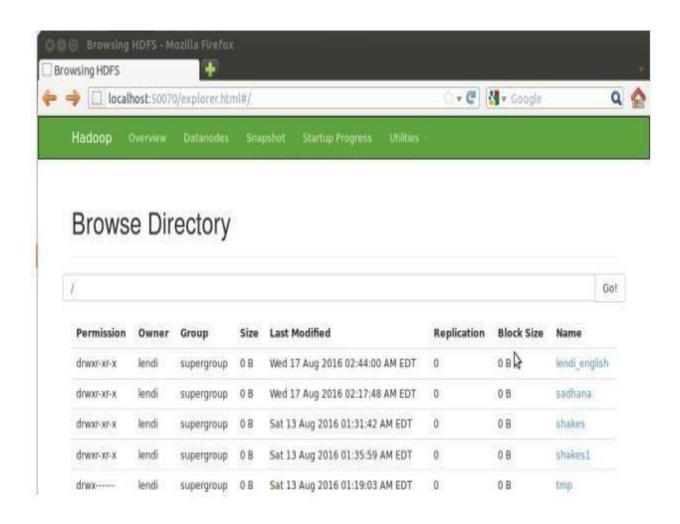

The Hadoop command get copies files from HDFS back to the local filesystem. To retrieve example.txt,

we can run the following command:

hadoop fs -cat example.txt

# **Deleting files from HDFS**

hadoop fs -rm example.txt

Ex.No:3	IMPLEMENT OF MATRIX MULTIPLICATION WITH HADOOP
Date:	MAP REDUCE

#### AIM:

To Develop a Map Reduce program to implement Matrix Multiplication.

#### **Procedure:**

In mathematics, matrix multiplication or the matrix product is a binary operation that produces a matrix from two matrices. The definition is motivated by linear equations and linear transformations on vectors, which have numerous applications in applied mathematics, physics, and engineering. In more detail, if A is an  $n \times m$  matrix and B is an  $m \times p$  matrix, their matrix product AB is an  $n \times p$  matrix, in which the m entries across a row of A are multiplied with the m entries down a column of B and summed to produce an entry of AB. When two linear transformations are represented by matrices, then the matrix product represents the composition of the two transformations.

• Create two files M1, M2 and put the matrix values. (sperate columns with spaces and rows with a line break)

For this example I am taking matrices as:

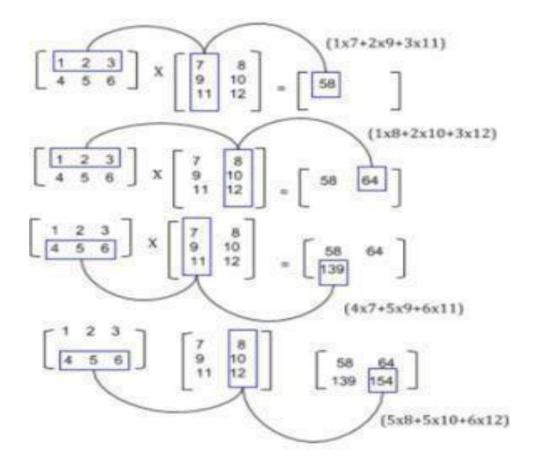

1 2 3 7 8 4 5 6 9 10 11 12

Put the above files to HDFS at location /user/clouders/matrices/

hdfs dfs -mkdir /user/cloudera/matrice

hdfs dfs -put /path/to/M1 /user/cloudera/matrices/

hdfs dfs -put /path/to/M2 /user/cloudera/matrices/

# Algorithm for Map Function.

- a. for each element  $m_{ij}$  of M do produce (key,value) pairs as ((i,k), (M,j, $m_{ij}$ ), for k=1,2,3,.. upto the number of columns of N
- b. for each element njk of N do produce (key,value) pairs as  $((i,k),(N,j,N_{jk}),$  for i=1,2,3,... Upto the number of rows of M.
- c. return Set of (key,value) pairs that each key (i,k), has list with values  $(M,j,m_{ij})$  and  $(N,j,n_{jk})$  for all possible values of j.

# Algorithm for Reduce Function.

- d. for each key (i,k) do
- e. sort values begin with M by j in listM sort values begin with N by j in listN multiply mij and njk for jth value of each list
- f. sum up mij x njk return (i,k),  $\Sigma j=1$  mij x njk

# Step 1. Download the hadoop jar files with these links.

Download Hadoop Common Jar files: https://goo.gl/G4MyHp \$ wget https://goo.gl/G4MyHp -O hadoop-common-2.2.0.jar Download Hadoop Mapreduce Jar File: https://goo.gl/KT8yfB \$ wget https://goo.gl/KT8yfB -O hadoop-mapreduce-client-core-2.7.1.jar

# Step 2. Creating Mapper file for Matrix Multiplication.

job.setOutputKeyClass(Text.class);
job.setOutputValueClass(IntWritable.class);
job.setInputFormatClass(TextInputFormat.class);
job.setOutputFormatClass(TextOutputFormat.class);
Path outputPath = new Path(args[1]);
//Configuring the input/output path from the filesystem into the job
FileInputFormat.addInputPath(job, new Path(args[0]));
FileOutputFormat.setOutputPath(job, new Path(args[1]));
//deleting the output path automatically from hdfs so that we don't have to
delete it explicitly
outputPath.getFileSystem(conf).delete(outputPath);
//exiting the job only if the flag value becomes false
System.exit(job.waitForCompletion(true) ? 0 : 1);
The entire MapReduce program can be fundamentally divided
into three parts:
• Mapper Phase Code
• Reducer Phase Code
• Driver Code
We will understand the code for each of these three parts
sequentially.
```

Mapper code: public static class Map extends

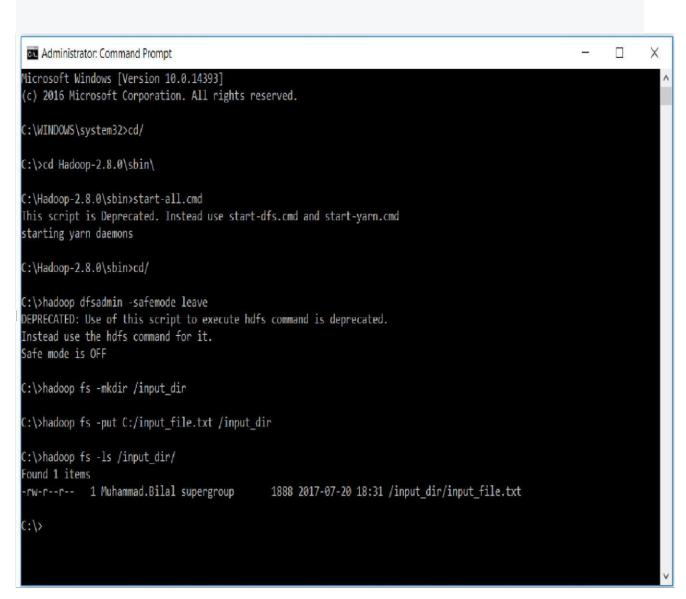

1. Create an input directory in HDFS.

# hadoop fs -mkdir /input\_dir

2. Copy the input text file named input\_file.txt in the input directory (input\_dir)of HDFS.

# hadoop fs -put C:/input\_file.txt /input\_dir

3. .. input filetxt available in H DFS input directory (input directory)

```
Mapper<LongWritable,Text,Text,IntWritable> {
public void map(LongWritable key, Text value, Context context) throws
IOException,InterruptedException {
String line = value.toString();
StringTokenizer tokenizer = new StringTokenizer(line);
while (tokenizer.hasMoreTokens()) {
value.set(tokenizer.nextToken());
context.write(value, new IntWritable(1));
}
• We have created a class Map that extends the classMapper which is already defined in the
MapReduce
Framework.
• We define the data types of input and output key/valuepair after the class declaration using angle
brackets.
• Both the input and output of the Mapper is a key/valuepair.
• Input:
• The key is nothing but the offset of each line in
the text file:LongWritable
• The value is each individual line (as shown in the
figure at the right): Text
• Output:
• The key is the tokenized words: Text
• We have the hardcoded value in our case which is
1: IntWritable
• Example – Dear 1, Bear 1, etc.
• We have written a java code where we have tokenizedeach word and assigned them a hardcoded
value equal
to 1.
Reducer Code:
public static class Reduce extends
Reducer<Text,IntWritable,Text,IntWritable> {
public void reduce(Text key, Iterable<IntWritable> values,Context
context)
throws IOException, Interrupted Exception {
int sum=0;
for(IntWritable x: values)
\{ sum+=x.get(); \}
}context.write(key, new IntWritable(sum));
```

# 1. Verify content of the copied file.

```
C:\>hadoop fs -ls /input_dir/
ound 1 items
-rw-r--r-- 1 Muhammad.Bilal supergroup
                                                    1888 2017-07-20 18:31 /input_dir/input_file.txt
C:\>hadoop dfs -cat /input_dir/input_file.txt
DEPRECATED: Use of this script to execute hdfs command is deprecated.
Instead use the hdfs command for it.

                                                                 45
```

```
}
• We have created a class Reduce which extends class
Reducer like that of Mapper.
• We define the data types of input and output key/valuepair after the class declaration using angle
brackets as
done for Mapper.
Both the input and the output of the Reducer is a keyvalue pair.
• Input:
• The key nothing but those unique words whichhave been generated after the sorting and shuffling
phase: Text
• The value is a list of integers corresponding to
each key: IntWritable
∘ Example – Bear, [1, 1], etc.
• Output:
• The key is all the unique words present in the input
text file: Text
• The value is the number of occurrences of each of
the unique words: IntWritable
∘ Example – Bear, 2; Car, 3, etc.
• We have aggregated the values present in each of the list corresponding to each key and produced
the final
answer.
• In general, a single reducer is created for each of theunique words, but, you can specify the number
reducer in mapred-site.xml.
Driver Code:
Configuration conf= new Configuration();
Job job = new Job(conf,"My Word Count Program");
job.setJarByClass(WordCount.class);
job.setMapperClass(Map.class);
job.setReducerClass(Reduce.class);
job.setOutputKeyClass(Text.class);
job.setOutputValueClass(IntWritable.class);
job.setInputFormatClass(TextInputFormat.class);
job.setOutputFormatClass(TextOutputFormat.class);
Path outputPath = new Path(args[1]);
```

//Configuring the input/output path from the filesystem into the job

FileInputFormat.addInputPath(job, new Path(args[0])); FileOutputFormat.setOutputPath(job, new Path(args[1]));

- In the driver class, we set the configuration of our
  - 1. Run MapReduceClient.jar and also provide input and out directories.

## hadoop jar C:/MapReduceClient.jar wordcount /input\_dir /output\_dir

```
Administrator: Command Prompt
                                                                                                                      X

   he path of <sup>t</sup>he inpu<sup>t</sup> and outpu<sup>t f</sup>olde<sup>r</sup> is a<sup>l</sup>so specified.
```

• The method setInputFormatClass () is used for specifying that how a Mapper will read the input data or what will be the unit of work. Here, we have chosen TextInputFormat so that single line is read by the mapper at a time from the input text file

The main () method is the entry point for the driver. In this method, we instantiate a new Configuration object for the job.

Run the MapReduce code:

The command for running a MapReduce code is: hadoop jar hadoop-mapreduce-example.jar WordCount / sample/input /sample/output

1. Verify content for generated output file.

# hadoop dfs -cat /output\_dir/\*

```
C:\>hadoop dfs -cat /output dir/*
DEPRECATED: Use of this script to execute hdfs command is deprecated.
Instead use the hdfs command for it.

# hadoop fs -rm -r /iutput\_dir/input\_file.txt

5) To delete directory from HDFS directory

hadoop fs -rm -r /iutput\_dir

Ex.No:5	INSTALLATION OF HIVE ALONG WITH PRACTICE EXAMPLES	
Date:	INSTALLATION OF HIVE ALONG WITH FRACTICE EARWIFLES	

#### AIM:

To write a program to Installation of Hive along with practice examples

#### **PROCEDURE:**

# Step 1: Verifying JAVA Installation

Java must be installed on your system before installing Hive. Let us verify java installation using the following command:

```
$ java –version
```

If Java is already installed on your system, you get to see the following response:

```
java version "1.7.0_71"

Java(TM) SE Runtime Environment (build 1.7.0_71-b13)

Java HotSpot(TM) Client VM (build 25.0-b02, mixed mode)
```

If java is not installed in your system, then follow the steps given below for installing java.

Installing Java Step I:

Download java (JDK <latest version> - X64.tar.gz) by visiting the following link <a href="http://www.oracle.com/technetwork/java/javase/downloads/jdk7-downloads-1880260.html">http://www.oracle.com/technetwork/java/javase/downloads/jdk7-downloads-1880260.html</a>.

Then jdk-7u71-linux-x64.tar.gz will be downloaded onto your system.

Step II:

Generally you will find the downloaded java file in the Downloads folder. Verify it and extract the jdk-7u71-linux-x64.gz file using the following commands.

```
$ cd Downloads/
$ ls
jdk-7u71-linux-x64.gz
$ tar zxf jdk-7u71-linux-x64.gz
$ ls
jdk1.7.0_71 jdk-7u71-linux-x64.gz
```

Step III:

To make java available to all the users, you have to move it to the location "/usr/local/". Open root, and type the following commands.

```
$ su
password:
# mv jdk1.7.0_71 /usr/local/
# exit
```

Step IV:

For setting up PATH and JAVA\_HOME variables, add the following commands to ~/.bashrc file.

```
export JAVA_HOME=/usr/local/jdk1.7.0_71
export PATH=$PATH:$JAVA_HOME/bin
```

Now apply all the changes into the current running system.

```
$ source ~/.bashrc
```

Step V:

Use the following commands to configure java alternatives:

```
# alternatives --install /usr/bin/java/java/usr/local/java/bin/java 2

# alternatives --install /usr/bin/javac/javac/usr/local/java/bin/javac 2

# alternatives --install /usr/bin/jar/usr/local/java/bin/jar 2

# alternatives --set java/usr/local/java/bin/java

# alternatives --set javac/usr/local/java/bin/javac

# alternatives --set javac/usr/local/java/bin/javac
```

Now verify the installation using the command java -version from the terminal as explained above.

#### **Step 2: Verifying Hadoop Installation**

Hadoop must be installed on your system before installing Hive. Let us verify the Hadoop installation using the following command:

```
$ hadoop version
```

If Hadoop is already installed on your system, then you will get the following response:

```
Hadoop 2.4.1 Subversion https://svn.apache.org/repos/asf/hadoop/common -r 1529768
Compiled by hortonmu on 2013-10-07T06:28Z
Compiled with protoc 2.5.0
From source with checksum 79e53ce7994d1628b240f09af91e1af4
```

If Hadoop is not installed on your system, then proceed with the following steps:

Downloading Hadoop

Download and extract Hadoop 2.4.1 from Apache Software Foundation using the following commands.

```
$ su password:
# cd /usr/local
# wget http://apache.claz.org/hadoop/common/hadoop-2.4.1/
hadoop-2.4.1.tar.gz
# tar xzf hadoop-2.4.1.tar.gz
# mv hadoop-2.4.1/* to hadoop/
# exit
```

Installing Hadoop in Pseudo Distributed Mode

The following steps are used to install Hadoop 2.4.1 in pseudo distributed mode.

Step I: Setting up Hadoop

You can set Hadoop environment variables by appending the following commands to ~/.bashrc file.

```
export HADOOP_HOME=/usr/local/hadoop
export HADOOP_MAPRED_HOME=$HADOOP_HOME
export HADOOP_COMMON_HOME=$HADOOP_HOME
export HADOOP_HDFS_HOME=$HADOOP_HOME
export YARN_HOME=$HADOOP_HOME
export HADOOP_COMMON_LIB_NATIVE_DIR=$HADOOP_HOME/lib/native export
PATH=$PATH:$HADOOP_HOME/sbin:$HADOOP_HOME/bin
```

Now apply all the changes into the current running system.

```
$ source ~/.bashrc
```

Step II: Hadoop Configuration

You can find all the Hadoop configuration files in the location "\$HADOOP\_HOME/etc/hadoop". You need to make suitable changes in those configuration files according to your Hadoop infrastructure.

```
$ cd $HADOOP_HOME/etc/hadoop
```

In order to develop Hadoop programs using java, you have to reset the java environment variables in **hadoop-env.sh** file by replacing **JAVA\_HOME** value with the location of java in your system.

```
export JAVA_HOME=/usr/local/jdk1.7.0_71
```

Given below are the list of files that you have to edit to configure Hadoop.

#### core-site.xml

The **core-site.xml** file contains information such as the port number used for Hadoop instance, memory allocated for the file system, memory limit for storing the data, and the size of Read/Write buffers.

Open the core-site.xml and add the following properties in between the <configuration> and </configuration> tags.

```
<name>fs.default.name</name>
<value>hdfs://localhost:9000</value>
</property>
</configuration>
```

#### hdfs-site.xml

The **hdfs-site.xml** file contains information such as the value of replication data, the namenode path, and the datanode path of your local file systems. It means the place where you want to store the Hadoop infra.

Let us assume the following data.

```
dfs.replication (data replication value) = 1

(In the following path /hadoop/ is the user name. hadoopinfra/hdfs/namenode is the directory created by hdfs file system.)

namenode path = //home/hadoop/hadoopinfra/hdfs/namenode

(hadoopinfra/hdfs/datanode is the directory created by hdfs file system.)

datanode path = //home/hadoop/hadoopinfra/hdfs/datanode
```

Open this file and add the following properties in between the <configuration>, </configuration> tags in this file.

**Note:** In the above file, all the property values are user-defined and you can make changes according to your Hadoop infrastructure.

#### yarn-site.xml

This file is used to configure yarn into Hadoop. Open the yarn-site.xml file and add the following properties in between the <configuration>, </configuration> tags in this file.

## mapred-site.xml

This file is used to specify which MapReduce framework we are using. By default, Hadoop contains a template of yarn-site.xml. First of all, you need to copy the file from mapred-site,xml.template to mapred-site.xml file using the following command.

```
$ cp mapred-site.xml.template mapred-site.xml
```

Open **mapred-site.xml** file and add the following properties in between the <configuration>, </configuration> tags in this file.

Verifying Hadoop Installation

The following steps are used to verify the Hadoop installation.

```
Step I: Name Node Setup
```

Set up the namenode using the command "hdfs namenode -format" as follows.

```
$ cd ~
$ hdfs namenode -format
```

The expected result is as follows.

```
10/24/14 21:30:55 INFO namenode.NameNode: STARTUP_MSG:
/****************************
STARTUP_MSG: Starting NameNode
STARTUP_MSG: host = localhost/192.168.1.11
STARTUP_MSG: args = [-format]
STARTUP_MSG: version = 2.4.1
...
...
```

Step II: Verifying Hadoop dfs

The following command is used to start dfs. Executing this command will start your Hadoop file system.

### \$ start-dfs.sh

The expected output is as follows:

#### 10/24/14 21:37:56

Starting namenodes on [localhost]

localhost: starting namenode, logging to /home/hadoop/hadoop-2.4.1/logs/hadoop-hadoop-namenode-localhost.out

localhost: starting datanode, logging to /home/hadoop/hadoop-2.4.1/logs/hadoop-hadoop-datanode-localhost.out

Starting secondary namenodes [0.0.0.0]

Step III: Verifying Yarn Script

The following command is used to start the yarn script. Executing this command will start your yarn daemons.

## \$ start-yarn.sh

The expected output is as follows:

#### starting yarn daemons

starting resourcemanager, logging to /home/hadoop/hadoop-2.4.1/logs/yarn-hadoop-resourcemanager-localhost.out

localhost: starting nodemanager, logging to /home/hadoop/hadoop-2.4.1/logs/yarn-hadoop-nodemanager-localhost.out

Step IV: Accessing Hadoop on Browser

The default port number to access Hadoop is 50070. Use the following url to get Hadoop services on your browser.

http://localhost:50070/

# Step V: Verify all applications for cluster

The default port number to access all applications of cluster is 8088. Use the following url to visit this service.

#### **Step 3: Downloading Hive**

We use hive-0.14.0 in this tutorial. You can download it by visiting the following link <a href="http://apache.petsads.us/hive/hive-0.14.0/">http://apache.petsads.us/hive/hive-0.14.0/</a>. Let us assume it gets downloaded onto the /Downloads directory. Here, we download Hive archive named "apache-hive-0.14.0-bin.tar.gz" for this tutorial. The following command is used to verify the download:

```
$ cd Downloads
$ ls
```

On successful download, you get to see the following response:

```
apache-hive-0.14.0-bin.tar.gz
```

### **Step 4: Installing Hive**

The following steps are required for installing Hive on your system. Let us assume the Hive archive is downloaded onto the /Downloads directory.

Extracting and verifying Hive Archive

The following command is used to verify the download and extract the hive archive:

```
$ tar zxvf apache-hive-0.14.0-bin.tar.gz
$ ls
```

On successful download, you get to see the following response:

```
apache-hive-0.14.0-bin apache-hive-0.14.0-bin.tar.gz
Copying files to /usr/local/hive directory
```

We need to copy the files from the super user "su -". The following commands are used to copy the files from the extracted directory to the /usr/local/hive" directory.

```
$ su -
passwd:

# cd /home/user/Download

# mv apache-hive-0.14.0-bin /usr/local/hive

# exit
```

Setting up environment for Hive

You can set up the Hive environment by appending the following lines to ~/.bashrc file:

```
export HIVE_HOME=/usr/local/hive
export PATH=$PATH:$HIVE_HOME/bin
export CLASSPATH=$CLASSPATH:/usr/local/Hadoop/lib/*:.
export CLASSPATH=$CLASSPATH:/usr/local/hive/lib/*:.
```

The following command is used to execute ~/.bashrc file.

\$ source ~/.bashrc

# **Step 5: Configuring Hive**

To configure Hive with Hadoop, you need to edit the **hive-env.sh** file, which is placed in the **\$HIVE\_HOME/conf** directory. The following commands redirect to Hive **config** folder and copy the template file:

\$ cd \$HIVE HOME/conf

\$ cp hive-env.sh.template hive-env.sh

Edit the **hive-env.sh** file by appending the following line:

```
export HADOOP_HOME=/usr/local/hadoop
```

Hive installation is completed successfully. Now you require an external database server to configure Metastore. We use Apache Derby database.

# Step 6: Downloading and Installing Apache Derby

Follow the steps given below to download and install Apache Derby:

Downloading Apache Derby

The following command is used to download Apache Derby. It takes some time to download.

\$ cd ~

\$ wget http://archive.apache.org/dist/db/derby/db-derby-10.4.2.0/db-derby-10.4.2.0-bin.tar.gz

The following command is used to verify the download:

\$ 1s

On successful download, you get to see the following response:

```
db-derby-10.4.2.0-bin.tar.gz
```

Extracting and verifying Derby archive

The following commands are used for extracting and verifying the Derby archive:

\$ tar zxvf db-derby-10.4.2.0-bin.tar.gz

\$ ls

On successful download, you get to see the following response:

```
db-derby-10.4.2.0-bin db-derby-10.4.2.0-bin.tar.gz
```

Copying files to /usr/local/derby directory

We need to copy from the super user "su -". The following commands are used to copy the files from the extracted directory to the /usr/local/derby directory:

\$ su -

passwd:

# cd /home/user

```
# mv db-derby-10.4.2.0-bin/usr/local/derby # exit
```

Setting up environment for DerbyYou can set up the Derby environment by appending the following lines to **~/.bashrc** file:

```
export DERBY_HOME=/usr/local/derby
export PATH=$PATH:$DERBY_HOME/bin
Apache Hive
18 export
CLASSPATH=$CLASSPATH:$DERBY_HOME/lib/derby.jar:$DERBY_HOME/lib/derbytools.jar
```

The following command is used to execute ~/.bashrc file:

```
$ source ~/.bashrc
```

Create a directory to store Metastore

Create a directory named data in \$DERBY\_HOME directory to store Metastore data.

```
$ mkdir $DERBY_HOME/data
```

Derby installation and environmental setup is now complete.

## **Step 7: Configuring Metastore of Hive**

Configuring Metastore means specifying to Hive where the database is stored. You can do this by editing the hive-site.xml file, which is in the \$HIVE\_HOME/conf directory. First of all, copy the template file using the following command:

```
$ cd $HIVE_HOME/conf
$ cp hive-default.xml.template hive-site.xml
```

Edit **hive-site.xml** and append the following lines between the <configuration> and </configuration> tags:

```
<name>javax.jdo.option.ConnectionURL</name>
    <value>jdbc:derby://localhost:1527/metastore_db;create=true </value>
    <description>JDBC connect string for a JDBC metastore </description>
```

Create a file named jpox.properties and add the following lines into it:

```
javax.jdo.PersistenceManagerFactoryClass =

org.jpox.PersistenceManagerFactoryImpl
org.jpox.autoCreateSchema = false
org.jpox.validateTables = false
org.jpox.validateColumns = false
org.jpox.validateConstraints = false
org.jpox.storeManagerType = rdbms
```

```
org.jpox.autoStartMechanismMode = checked
org.jpox.transactionIsolation = read_committed

javax.jdo.option.DetachAllOnCommit = true
javax.jdo.option.NontransactionalRead = true
javax.jdo.option.ConnectionDriverName = org.apache.derby.jdbc.ClientDriver
javax.jdo.option.ConnectionURL = jdbc:derby://hadoop1:1527/metastore_db;create = true
javax.jdo.option.ConnectionUserName = APP
javax.jdo.option.ConnectionPassword = mine
```

Step 8: Verifying Hive Installation

Before running Hive, you need to create the /tmp folder and a separate Hive folder in HDFS. Here, we use the /user/hive/warehouse folder. You need to set write permission for these newly created folders as shown below:

```
chmod g+w
```

Now set them in HDFS before verifying Hive. Use the following commands:

```
$ $HADOOP_HOME/bin/hadoop fs -mkdir /tmp
$ $HADOOP_HOME/bin/hadoop fs -mkdir /user/hive/warehouse
$ $HADOOP_HOME/bin/hadoop fs -chmod g+w /tmp
$ $HADOOP_HOME/bin/hadoop fs -chmod g+w /user/hive/warehouse
```

The following commands are used to verify Hive installation:

```
$ cd $HIVE_HOME
$ bin/hive
```

On successful installation of Hive, you get to see the following response:

The following sample command is executed to display all the tables:

```
hive> show tables;
OK
Time taken: 2.798 seconds
hive>
```

### **Hive Examples:**

#### **OBJECTIVE:**

Use Hive to create, alter, and drop databases, tables, views, functions, and indexes.

#### **PROGRAM**:

SYNTAX for HIVE Database Operations

**DATABASE** Creation

CREATE DATABASE|SCHEMA [IF NOT EXISTS] <database name>

**Drop Database Statement** 

DROP DATABASE Statement DROP (DATABASE|SCHEMA) [IF EXISTS]

database\_name [RESTRICT|CASCADE];

Creating and Dropping Table in HIVE

CREATE [TEMPORARY] [EXTERNAL] TABLE [IF NOT EXISTS] [db\_name.]

table\_name

[(col\_name data\_type [COMMENT col\_comment], ...)]

[COMMENT table comment] [ROW FORMAT row format] [STORED AS

file format]

Loading Data into table log\_data

Syntax:

LOAD DATA LOCAL INPATH '<path>/u.data' OVERWRITE INTO TABLE

u\_data;

Alter Table in HIVE

Syntax

ALTER TABLE name RENAME TO new\_name

ALTER TABLE name ADD COLUMNS (col\_spec[, col\_spec ...])

ALTER TABLE name DROP [COLUMN] column\_name

ALTER TABLE name CHANGE column\_name new\_name new\_type

ALTER TABLE name REPLACE COLUMNS (col\_spec[, col\_spec ...])

Creating and Dropping View

CREATE VIEW [IF NOT EXISTS] view\_name [(column\_name [COMMENT

column\_comment], ...) ] [COMMENT table\_comment] AS SELECT ...

**Dropping View** 

Syntax:

DROP VIEW view\_name

Functions in HIVE

String Functions:- round(), ceil(), substr(), upper(), reg\_exp() etc

Date and Time Functions:- year(), month(), day(), to\_date() etc

Aggregate Functions :- sum(), min(), max(), count(), avg() etc

43

**INDEXES** 

CREATE INDEX index\_name ON TABLE base\_table\_name (col\_name, ...)

AS 'index.handler.class.name'

[WITH DEFERRED REBUILD]

[IDXPROPERTIES (property name=property value, ...)]

[IN TABLE index\_table\_name]

```
[PARTITIONED BY (col_name, ...)]

Ex.No:6	INSTALLATION OF HBASE, INSTALLING THRIFT ALONG WITH	
Date:	EXAMPLES	

#### AIM:

To write a procedure for Installation of HBase, Installing thrift along with examples.

#### **PROCEDURE:**

# **Installing HBase**

We can install HBase in any of the three modes: Standalone mode, Pseudo Distributed mode, and Fully Distributed mode.

## **Installing HBase in Standalone Mode**

Download the latest stable version of HBase form <a href="http://www.interior-dsgn.com/apache/hbase/stable/">http://www.interior-dsgn.com/apache/hbase/stable/</a> using "wget" command, and extract it using the tar "zxvf" command. See the following command.

\$cd usr/local/

\$wget http://www.interior-dsgn.com/apache/hbase/stable/hbase-0.98.8-

hadoop2-bin.tar.gz

\$tar -zxvf hbase-0.98.8-hadoop2-bin.tar.gz

Shift to super user mode and move the HBase folder to /usr/local as shown below.

\$su

\$password: enter your password here

mv hbase-0.99.1/\* Hbase/

# **Configuring HBase in Standalone Mode**

Before proceeding with HBase, you have to edit the following files and configure HBase.

hbase-env.sh

Set the java Home for HBase and open **hbase-env.sh** file from the conf folder. Edit JAVA\_HOME environment variable and change the existing path to your current JAVA\_HOME variable as shown below.

cd/usr/local/Hbase/conf gedit hbase-env.sh

This will open the env.sh file of HBase. Now replace the existing **JAVA\_HOME** value with your current value as shown below.

#### export JAVA\_HOME=/usr/lib/jvm/java-1.7.0

#### hbase-site.xml

This is the main configuration file of HBase. Set the data directory to an appropriate location by opening the HBase home folder in /usr/local/HBase. Inside the conf folder, you will find several files, open the **hbase-site.xml** file as shown below.

```
#cd /usr/local/HBase/
#cd conf
# gedit hbase-site.xml
```

Inside the **hbase-site.xml** file, you will find the <configuration> and </configuration> tags. Within them, set the HBase directory under the property key with the name "hbase.rootdir" as shown below.

With this, the HBase installation and configuration part is successfully complete. We can start HBase by using **start-hbase.sh** script provided in the bin folder of HBase. For that, open HBase Home Folder and run HBase start script as shown below.

\$cd /usr/local/HBase/bin \$./start-hbase.sh

If everything goes well, when you try to run HBase start script, it will prompt you a message saying that HBase has started.

starting master, logging to /usr/local/HBase/bin/../logs/hbase-tpmaster-localhost.localdomain.out Installing HBase in Pseudo-Distributed Mode

Let us now check how HBase is installed in pseudo-distributed mode.

# **Configuring HBase**

Before proceeding with HBase, configure Hadoop and HDFS on your local system or on a remote system and make sure they are running. Stop HBase if it is running.

### hbase-site.xml

Edit hbase-site.xml file to add the following properties.

```
<name>hbase.cluster.distributed</name>
  <value>true</value>
```

It will mention in which mode HBase should be run. In the same file from the local file system, change the hbase rootdir, your HDFS instance address, using the hdfs://// URI syntax. We are running HDFS on the localhost at port 8030.

```
<name>hbase.rootdir</name>
  <value>hdfs://localhost:8030/hbase</value>
```

### **Starting HBase**

After configuration is over, browse to HBase home folder and start HBase using the following command

\$cd /usr/local/HBase \$bin/start-hbase.sh

Note: Before starting HBase, make sure Hadoop is running.

## **Checking the HBase Directory in HDFS**

HBase creates its directory in HDFS. To see the created directory, browse to Hadoop bin and type the following command.

\$ ./bin/hadoop fs -ls /hbase

If everything goes well, it will give you the following output.

```
Found 7 items
```

```
drwxr-xr-x - hbase users 0 2014-06-25 18:58 /hbase/.tmp
drwxr-xr-x - hbase users 0 2014-06-25 21:49 /hbase/WALs
drwxr-xr-x - hbase users 0 2014-06-25 18:48 /hbase/corrupt
drwxr-xr-x - hbase users 0 2014-06-25 18:58 /hbase/data
-rw-r--r- 3 hbase users 42 2014-06-25 18:41 /hbase/hbase.id
-rw-r--r- 3 hbase users 7 2014-06-25 18:41 /hbase/hbase.version
drwxr-xr-x - hbase users 0 2014-06-25 21:49 /hbase/oldWALs
```

## **Starting and Stopping a Master**

Using the "local-master-backup.sh" you can start up to 10 servers. Open the home folder of HBase, master and execute the following command to start it.

\$ ./bin/local-master-backup.sh 2 4

To kill a backup master, you need its process id, which will be stored in a file named "/tmp/hbase-USER-X-master.pid." you can kill the backup master using the following command.

\$ cat /tmp/hbase-user-1-master.pid |xargs kill -9

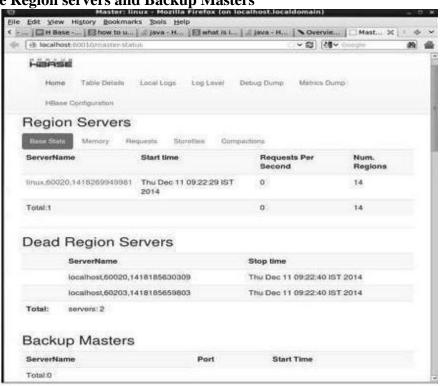

#### **HBase Web Interface**

To access the web interface of HBase, type the following url in the browser.

http://localhost:60010

This interface lists your currently running Region servers, backup masters and HBase tables.

**HBase Region servers and Backup Masters** 

# **Starting and Stopping RegionServers**

You can run multiple region servers from a single system using the following command.

\$ .bin/local-regionservers.sh start 2 3

To stop a region server, use the following command.

\$.bin/local-regionservers.sh stop 3

## **Starting HBaseShell**

After Installing HBase successfully, you can start HBase Shell. Below given are the sequence of steps that are to be followed to start the HBase shell. Open the terminal, and login as super user.

#### **Start Hadoop File System**

Browse through Hadoop home sbin folder and start Hadoop file system as shown below.

\$cd \$HADOOP\_HOME/sbin

\$start-all.sh

#### **Start HBase**

Browse through the HBase root directory bin folder and start HBase.

\$cd /usr/local/HBase

\$./bin/start-hbase.sh

#### **Start HBase Master Server**

This will be the same directory. Start it as shown below.

\$./bin/local-master-backup.sh start 2 (number signifies specific server.)

#### **Start Region**

Start the region server as shown below.

\$./bin/./local-regionservers.sh start 3

#### **Start HBase Shell**

You can start HBase shell using the following command.

\$cd bin

\$./hbase shell

This will give you the HBase Shell Prompt as shown below.

2014-12-09 14:24:27,526 INFO [main] Configuration.deprecation:

# **HBase Tables**

RESULT:					
Thus, the program to Install and verified successfully.	lation of HBase,	, Installing thi	rift along with	n examples was	s executed
					83

Ex.No:7	IMPORTING AND EXPORTING DATA FROM VARIOUS
Date:	DATABASES

#### AIM:

To write a procedure for Importing and exporting data from various databases

#### **PROCEDURE:**

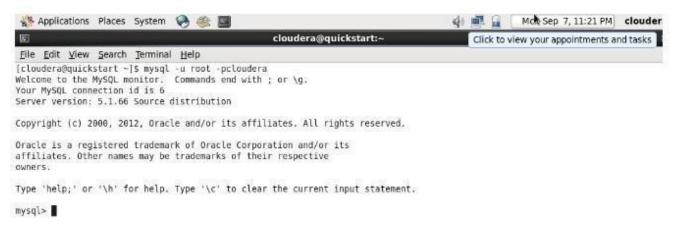

**SQOOP** is basically used to transfer data from relational databases such as MySQL, Oracle to data warehouses such as Hadoop HDFS (Hadoop File System). Thus, when data is transferred from a relational database to HDFS, we say we are **importing data**. Otherwise, when we transfer data from HDFS to relational databases, we say we are **exporting data**.

**Note:** To import or export, the order of columns in both MySQL and Hive should be the same.

## Importing data from MySQL to HDFS

In order to store data into HDFS, we make use of Apache Hive which provides an SQL-like interface between the user and the Hadoop distributed file system (HDFS) which integrates Hadoop. We perform the following steps:

**Step 1:** Login into MySQL mysql -u root –pcloudera

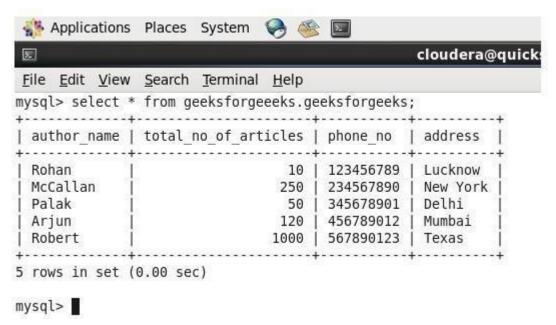

**Step 2:** Create a database and table and insert data.

create database geeksforgeeeks;

create table geeksforgeeks.geeksforgeeks(author\_name varchar(65), total\_no\_of\_articles int,

phone\_no int, address varchar(65)); insert into geeksforgeeks values("Rohan",10,123456789,"Lucknow");

**Step 3:** Create a database and table in the hive where data should be imported. create table geeks\_hive\_table(name string, total\_articles int, phone\_no int, address string) row format delimited fields terminated by ,,,";

```
Step 4: Run below the import command on Hadoop.
sqoop import --connect \
jdbc:mysql://127.0.0.1:3306/database_name_in_mysql \
--username root --password cloudera \
--table table_name_in_mysql \
--hive-import --hive-table database_name_in_hive.table_name_in_hive \
--m 1
```

In the above code following things should be noted.

- 127.0.0.1 is localhost IP address.
- 3306 is the port number for MySQL.
- **m** is the number of mappers

**Step 5:** Check-in hive if data is imported successfully or not.

#### **Exporting data from HDFS to MySQL**

To export data into MySQL from HDFS, perform the following steps:

## **Step 1:** Create a database and table in the hive.

create table hive\_table\_export(name string,company string, phone int, age int) row format delimited fields terminated by ,,,";

## **Step 2:** Insert data into the hive table.

insert into hive\_table\_export values("Ritik","Amazon",234567891,35);

Data in Hive table

Step 3: Create a database and table in MySQL in which data should be exported.

```
Step 4: Run the following command on Hadoop.
```

```
sqoop export --connect \
jdbc:mysql://127.0.0.1:3306/database_name_in_mysql \
--table table_name_in_mysql \
--username root --password cloudera \
--export-dir /user/hive/warehouse/hive_database_name.db/table_name_in_hive \
--m 1 \
-- driver com.mysql.jdbc.Driver
--input-fields-terminated-by ','
```

**Step 5:** Check-in MySQL if data is exported successfully or not.

## **RESULT:**

Thus, the program to Importing and exporting data from various databases was, executed and verified successfully.
